

For Immediate Release

IBM Selects IPSecurityCenter as the Platform for their Command and Control Center Solution

WOKING, Surrey—September 15, 2008— CNL, a leading developer of Integrated Situation Management software, has been selected by IBM Global Technology Services to provide the platform for their latest physical security solution, the IBM Physical Security Services - command and control center solution (CCC).

CNL is a pioneer in the rapidly growing, fully-integrated, IP-based security solution market. They have been one of the key advocates of open technology-based security solutions, opposing the closed proprietary systems that currently dominate the global security industry. The CCC solution is a result of their collaboration with IBM.

IBM Physical Security Services – CCC solution is designed to provide one of the most advanced physical security integration solutions in the market. It enables organizations to control, monitor and maintain disparate security systems and assets through a single interface. Virtually any device can be controlled by CCC via built-in workflow designers including CCTV, intruder alarms, fire alarms, access control, personal alarms, building management systems, digital recording and business systems.

CCC creates a management layer that sits above these security applications, providing customizable presentation of surveillance, alarm and event management. It escalates incidents to the point of need, increasing situational awareness, allowing greater collaboration both within organizations and with ERTs and reducing the overall cost of security operations.

A key value of CCC is the intrinsic compliance to security policies and enforced procedures based on clearly defined response plans. The system also provides detailed recording and reporting functionality, which helps minimize risk and exposure.

Keith Bloodworth, CEO of CNL says “We are delighted IBM has selected IPSecurityCenter. IBM brings with them their extensive IT and business process experience, which when applied to physical security creates some very effective solutions. This is the catalyst the industry needs to start adopting some of integrated solutions we have all been so excited about.”

CNL and IBM will be demonstrating this integrated security management software on the IBM booth (411) at ASIS 2008 in Atlanta, GA.

IBM Physical Security Services - CCC solution highlights;

- Integration of all physical security systems
- Improved compliance through enforced security policies
- Greater security collaboration within and across organizations
- Increased situational awareness
- Comprehensive services approach ensures successful results

About CNL

CNL is a leading developer of Integrated Situation Management software and is a pioneer in the open platform IP-based security solution market. The company's flagship product, IPSecurityCenter™, is a unique Integrated Situation Management solution, which centralises all security applications, irrespective of manufacturer, to form a real command and control solution. This increases situational awareness, allows greater collaboration both within organisations and with Emergency Response Teams, and reduces the overall cost of security operations. www.cnluk.com.
